

NOTES:

- **File naming convention is: (music)_cue_stem_timesig_tempo_length in Bars**
- All files in 24bit 48k WAV and 320kbs MP3
- 3 vibestates (indifference/wanting/rejecting) in 3 sets of modifier states (nomod/unheard/exhausted) with 5 levels of intensity for each.
- 1:45 total length of all audio files - 5.6 seconds divisions (for 1 bar of 7/4 time at 75bpm) all will loop at end point cleanly without crossfades.
- transitions between vibestates should always take place at one bar divisions (see above), otherwise I make no guarantees that it wont sound momentarily terrible. I would also recommend a crossfade of something like 2-2.5 seconds-ish to bring in the new vibe state. Technically it can start right away without a lot of bad notes but it will likely not be smooth and draw attention to itself.
- when adding or subtracting an intensity level within a "vibe state" I don't think you would have to strictly adhere to a 1-bar/5.6sec frequency to avoid jarring moments. I'm thinking a short fade in/out of approx. 1 second would be fine at any given moment. You might even be able to just drop it in with a 50ms crossfade depending on where it is.
- As an added bonus (yay) I made us some "One Last Thing" Title screen/main menu music in case we decide to do that. This is the same length as the other loops (but its not designed to be played with anything else) I have it as a stereo mix.
- There's also a one bar long transition/exit that can play to usher us out of the title music and into the game play music. If possible, have that drop on a bar division (same as the other loops) or at the very least just cross fade into it for a couple seconds so it doesn't sound too clumsy.
